Information about the energy quality of a building is in a document known as the energy label. In order to have this label, an energy certification must be carried out with a program recognized by the administration.

This certification is achieved with the CE3X program which stands out for its ease of use. It is very important to know how this software works to be able to correctly enter all the requested data and to be able to interpret any building and define it correctly in the program.

This course explains in a practical way the operation of this software applied in tertiary buildings, analyzing all the parameters of the program and dealing with real cases.

Reducing CO2 emissions and pollution levels in our towns and cities are inexcusable needs. Gradually replacing the classic electrical energy production and distribution systems, based on fossil fuels, is necessary.

Self-consumption, based on photovoltaic panels, makes it possible to produce, consume, share and store energy in a more efficient, sustainable and responsible way. Architects must foresee the implementation of this new type of technology in our projects.

Course aimed at architects, technical architects, real estate developers, managers and all kinds of professionals interested in designing and building more sustainable and energy efficient buildings.
